WASTE SOURCE Depleted Uranium Furnaces used as part of tritium processing operations.
Waste stream will arise as part of the clean-out of the Chapelcross Processing Plant.

PHYSICAL CHARACTERISTICS

General description: The uranium furnaces are stainless steel with external copper water cooling rings. Each furnace contains 25 kg of depleted uranium chips (~0.4% 235U).

Changes since waste generated: -

Bulk density (t/m³): = 1.5

Comment on density: The mean density of 1.48t/m³ refers to the mass of the components divided by the volume as stored.
