WASTE SOURCE Decommissioning of a PIE facility.

PHYSICAL CHARACTERISTICS

General description: The waste comprises materials which have been removed during the consolidation of intermediate level wastes, and various waste materials from the decommissioning of redundant plant. There are also secondary materials such as used PPE, swabs etc. associated with the management of these wastes.

Changes since waste generated: -

Bulk density (t/m³): = 1.9

Comment on density: Density taken from WSCD. This density is for the waste following any treatments i.e. supercompaction.

CHEMICAL COMPOSITION

General description and components (%wt): Metal, concrete and building rubble, cellulose, plastics and rubber.

Chemical state: Neutral

Sheet metal proportion / thickness: Bulky materials such as large metal containers generated during the consolidation of intermediate levels wastes are present.
