WASTE SOURCE Contaminated liquid mercury.

PHYSICAL CHARACTERISTICS

General description: Radiologically contaminated liquid mercury. The majority of the mercury is contained within 250cc pots, there are also a number of 200 litre polyethylene drums and a small number of additional containers within fume cupboards.

Changes since waste generated: -

Bulk density (t/m³): = 13.6

Comment on density: Density of mercury.

TREATMENT, PACKAGING AND DISPOSAL

Planned on-site / off-site treatment(s):

Treatment	On-site / Off-site	Stream volume %
Size reduction Decay storage Low force compaction Supercompaction (HFC) Incineration Drying/dewatering/liquid separation Tie down/fixatives/strippable coating/painting application Decontamination Metal treatment Recycling / reuse Thermal treatment, including vitrification Encapsulation Polymer encapsulation Other physical treatment Other chemical treatment Containerisation Treatment not yet determined None	Off-site	= 100.0

Comments on planned treatments:

The current plan is that contaminated mercury can be disposed of through incineration but this route has yet to be confirmed.
