WASTE TYPE ILW

WASTE VOLUMES

	Reported (m ³)	OR	Conditioned (m ³)	Packaged (m ³)
Stocks:	At 1.4.2025	= 47.0		
Future arisings:				
Total future arisings:		0.0		
Total waste volume:		47.0		

Number of waste packages in stock: At 1.4.2025..... - packages

Comment on arising rates: -

Additional information on quantities: Gravel will be removed from the vault when the wastes accumulated in the vault are retrieved. There will be no further arisings of this waste.

Uncertainty factors on volumes:

Stock (upper):	x 1.20	Arisings (upper):	x -
Stock (lower):	x 0.80	Arisings (lower):	x -

WASTE SOURCE Contaminated gravel (stone chippings) on the floor of the Vault. The gravel was applied before any waste was discharged to the facility.

PHYSICAL CHARACTERISTICS

General description: The waste comprises the gravel that was placed at the bottom of the vault, along with the associated sludge type material. This material, known as the amalgam, consists of the waste materials which have dropped in from the waste above during the history of filling the vaults, and which will also fall in during the waste retrieval phase. The gravel will therefore contain graphite chunks, springs, dusts, Magnox sludge, made up of magnesium carbonate and magnesium hydroxide, and mild steel corrosion products, from the waste containers and MCI streams. There may also be small amounts of Ternary Eutectic Chloride, vermiculite and ion exchange material. The gravel is coarse in nature, typically 50mm in diameter, but of unknown chemical composition. It may be either silica or limestone based material. There is a range in the volume of the vaults amalgam due to the uncertainties in how much each waste item will contribute to the amalgam. There are no large items.

Changes since waste generated: -

Bulk density (t/m³): ~ 1.5

Comment on density: The gravel is coarse in nature (typically 50mm across) and is assumed to be either limestone or silica based.

CHEMICAL COMPOSITION

General description and components (%wt): The chemical composition of the gravel chippings is not known, although it is likely to be either silica or limestone based material. Magnesium carbonate and magnesium hydroxide will be present, along with phenol formaldehyde and alumino-silicate ion exchange materials, TEC fire powders and vermiculite. Fission products, actinides and other activation products will be present as contaminants.

Chemical state: Alkali

Sheet metal proportion / thickness: Metals will be present as corrosion products or as small item contamination so metal thicknesses are expected to be typically be 1 or 2 mm.

Metals and alloys (%wt):

	(%wt)	Type(s) / Grades(s) with proportions	% of total C14 activity
Stainless steel.....	NE	-	Only trace metallic content would be expected to be associated with the original gravel but there may be contamination from the wastes resting on the gravel.

Management Routes:

Disposal Route	Stream volume %	Raw density t/m³	Start date
Expected to be consigned to a Near Site, Near Surface Disposal Facility (Scotland)	100.0		
Expected to be Non-NSD HAW managed under Scottish Government's policy			
Expected to be disposed to LLW Vaults NRS Dounreay			
Expected to be consigned to the Geological Disposal Facility			
Expected to be consigned to a Near Surface Disposal Facility			
Expected to be consigned to the LLW Repository			
Expected to be consigned to a Landfill Facility			
Expected to be disposed On-Site			
Expected to be managed by In-Situ Disposal			
Expected to be consigned to an Incineration Facility			
Expected to be consigned to a Metal Treatment Facility			
Expected to be Out of Scope			
Expected to be recycled / reused			
Disposal route not known			

Classification codes for waste expected to be consigned to a landfill facility:

Opportunities for alternative disposal routing: No

Baseline Management Route	Opportunity Management Route	Stream volume (%)	Opportunity Confidence	Comment
-	-	-	-	-

RADIOACTIVITY

Source: Contamination may have been transferred to the chippings via direct contact with waste materials. The ability of the chippings to absorb soluble active materials depends on the chemical composition of the chippings themselves.

Uncertainty: The waste is assumed to be ILW. This can be confirmed only when the waste is retrieved. The gravel is not expected to be washed to reduce activity.

Measurement of radioactivities: The activity has been derived from the activities of the wastes contained in the vault.

Chemical form of radionuclides: H-3: Any tritium is expected to be present as water but some may be in the form of other inorganic compounds or as organic compounds.
C-14: Chemical form of carbon 14 has not been determined but may be graphite.
Cl-36: The chemical form of chlorine 36 in these wastes is not known.
Se-79: The selenium content is insignificant.
Tc-99: The technetium content is insignificant.
I-129: -
Ra: Radium isotope content is expected to be insignificant.
Th: The thorium isotope content is insignificant.
U: Chemical form of U isotopes has not been determined but may be oxides.
Np: The neptunium content is insignificant.
Pu: Chemical form of plutonium isotopes has not been determined but may be plutonium oxides.
