Comment on arising rates: -

Additional information on quantities: Cyclone dust within 20 dust bowls. Volume has been calculated using dimensions of these dust bowls and survey data to determine the level that the bowls are filled to.

Uncertainty factors on volumes:

WASTE SOURCE

The cyclone filters and desiccant vessels within the CO2 filter rooms were used to remove particulates and water vapour from the coolant CO2 gas. During normal operations, a small proportion of the coolant gas was continuously passed through the multicyclones and then the drying plants. Particulate material was collected within the dust canister of each cyclone, shielded by a dust bowl. The very fine particulate comprises of graphite dust and reactor vessel/component corrosion products, generated as a result of graphite core erosion and gradual corrosion/degradation of other mainly steel materials.

PHYSICAL CHARACTERISTICS

General description: Graphite dust.

Changes since waste generated: -

Bulk density (t/m³): ~ 0.56

Comment on density: Assumed to be the same as 9B83/C data of graphite dust only (without pots).
