WASTE SOURCE There are 11 Debris Removal Ducts installed per reactor. These are designed to collect reactor debris such as loose lower tubes from the gag unit assemblies and a variety of other items. The Debris Removal Ducts are already included within Reactor Dismantling & Site Clearance but this waste stream addresses the debris held in the Debris Removal Ducts.

PHYSICAL CHARACTERISTICS

General description: Materials known to be present in the Debris Removal Ducts are the lower tubes from the gag unit assemblies (mild steel). Other components could be present.

Conditioning method:

Waste will be conditioned when removed from the reactor. The waste is not expected to be supercompacted. It will be placed in baskets in the waste packages and is now assumed to be encapsulated.

Conditioning plants:

Plant Name	Location
RDC Encap HPA	Hinkley Point A

Likely conditioning matrix:

Unknown

Further information on the conditioning matrix:

It is now expected that the waste will be encapsulated. The matrix could be BFS/OPC.

Waste Packaging:

Likely container type:	Container	Waste packaged (vol%)	Waste loading (m³)	Payload (m³)	Number of packages	Estimated start date for packaging
	4 m box (0 mm concrete shielding)	100.0	16.2	18.9	1	-

Range in container waste loading: Not yet determined.

Other information on packaging and conditioning: The waste will be in baskets placed in the waste packages. Baskets of different Reactor Dismantling & Site Clearance ILW may be in the same waste package. The container material is expected to be stainless steel.

Conditioned density (t/m³): ~ 3.0
