WASTE SOURCE Sand from sand pressure filters in the Pond Water Treatment Plant. Sludge and solids are removed by mechanical filtration through a bed of sand which is then backwashed into sludge tanks. The filters will be emptied of sand when the ponds are decommissioned.

PHYSICAL CHARACTERISTICS

General description: Mineral sand, containing high levels of activity due to the significant quantities of entrained sludge within the sand filter bed.

Changes since waste generated: Expected to be emptied using a vacuum retrieval method.

Bulk density (t/m³): = 2.6

Comment on density: The density varies between 2.5 - 2.7 t/m³.

CHEMICAL COMPOSITION

General description and components (%wt): Sand (90%), Sludge (10%).

Chemical state: Neutral

Sheet metal proportion / thickness: Any metals will be present as small particles in trace quantities.
There are likely to be traces of metals and metallic corrosion products, including magnesium and ferrous metals.

RADIOACTIVITY

Source: Activity from the cleanup of Fuel Storage Pond Water.

Uncertainty: Activity retained on the filter media cannot be known with accuracy until the filters are decommissioned and emptied.

Measurement of radioactivities: Based on activities found on sludge.

Chemical form of radionuclides: H-3: Most tritium is expected to be present as water but some may be present in the form of other inorganic compounds or as organic compounds.
C-14: Carbon-14 may be present as graphite.
Cl-36: -
Se-79: The selenium content is insignificant.
Tc-99: The technetium content is insignificant.
I-129: -
Ra: The radium content is insignificant.
Th: The thorium content is insignificant.
U: The chemical form of uranium isotopes has not been determined but will probably be uranium oxides.

Np: The chemical form of neptunium has not been determined.
Pu: The chemical form of plutonium isotopes has not been determined but will probably be plutonium oxides.
