TREATMENT, PACKAGING AND DISPOSAL

Planned on-site / off-site treatment(s):

Treatment	On-site / Off-site	Stream volume %
Size reduction		
Decay storage		
Low force compaction		
Supercompaction (HFC)	Off-site	~ 10.0
Incineration	Off-site	~ 70.0
Drying/dewatering/liquid separation		
Tie down/fixatives/strippable coating/painting application		
Decontamination		
Metal treatment	Off-site	~ 10.0
Recycling / reuse		
Thermal treatment, including vitrification		
Encapsulation	On-site	< 5.0
Polymer encapsulation		
Other physical treatment		
Other chemical treatment		
Containerisation		
Treatment not yet determined		
None		~ 5.0

Comments on planned treatments:

Material breakdown is not fully underpinned but future arisings are expected to be similar to routine operational low level waste arisings. In line with the waste hierarchy, wastes will be treated preferentially by incineration, metal decontamination/melting, supercompaction, optimal packaging in HHISOs or immobilisation by encapsulation where necessary, prior to ultimate disposal at the LLW Repository. These treatments will be carried out off-site under contract with companies such as LLWR Ltd, Cyclife, Tradebe Inutec. The percentages are based on the history of consignments across the fleet of EDF Energy Nuclear Generation stations.

RADIOACTIVITY

Source: The main sources of activity in the waste will be variable.

Uncertainty: The activity values quoted are indicative of the activities that may be expected. The activity estimates are thought to be accurate to within a factor of 10.

Measurement of radioactivities: Theoretical assessment. Specific activity is a function of station operating history. The values quoted are indicative of the activities that might be expected. "Other" beta/gamma activities expected to be present are (in TBq/m³):- Co57 (2E-8) and Co58 (1E-08)."
