WASTE SOURCE

All radiation controlled areas of the nuclear auxiliary building, fuel building, safeguards buildings, reactor building, operational production centre, access building and effluent treatment building are served by dedicated ventilation systems. The extract from these systems is subject to a number of airborne activity abatement techniques, including the use of High Efficiency Particulate Air (HEPA) filtration, before discharge to the environment. The HEPA filters remove particulate material to ensure doses to workers are ALARP and discharges to the environment are minimised. This also ensures that the doses to members of the public from airborne discharges are minimised. The abatement systems will produce a number of spent LLW pre and HEPA filters over the course of reactor operations. In addition to the filters serving the primary systems, LLW water filters will be generated from the filtration of low activity effluent (TEU, APG). The physical form of this waste stream consists of filter cartridges that are composed principally of stainless steel supports with glass fibre filter media and some organic materials.

PHYSICAL CHARACTERISTICS

General description:

Cartridge filters composed principally of stainless steel supports with a filter medium and some organic materials. HEPA filters with glass fibre filter media.

TREATMENT, PACKAGING AND DISPOSAL

Planned on-site / off-site treatment(s):

Treatment	On-site / Off-site	Stream volume %
Size reduction	Off-site	NE
Decay storage		
Low force compaction	Off-site	NE
Supercompaction (HFC)		
Incineration		
Drying/dewatering/liquid separation		
Tie down/fixatives/strippable coating/painting application		
Decontamination		
Metal treatment		
Recycling / reuse		
Thermal treatment, including vitrification		
Encapsulation		
Polymer encapsulation		
Other physical treatment		
Other chemical treatment		
Containerisation		
Treatment not yet determined		
None		

Comments on planned treatments:

Both air and water filters will primarily be sent for incineration following onsite- size reduction. Filters that cannot be incinerated will be sent for supercompaction and if that isn't possible they will be managed, conditioned and sent for direct LLWR disposal.

Conditioning method:

-

Conditioning plants:

RADIOACTIVITY

Source: The abatement systems will produce a number of spent HEPA filters over the course of reactor operations. These HEPA filters have the potential to be classed as radioactive waste should they have arrested any radioactive particulate or aerosol. The low active effluent water filters are composed principally of stainless steel supports with a filter medium and some organic materials. The amount of particulate radioactive material (metallic oxides) trapped on each filter may be variable.
