WASTE SOURCE The waste will arise from the removal of activated stainless steel components from the reactor.

PHYSICAL CHARACTERISTICS

General description: Stainless steel components of various size and mass with trace exotic metallics. Secondary wastes in the form of swabs and contaminated RPE/PPE from characterisation and decontamination.

Changes since waste generated: There has been no physical/chemical changes to the waste.

Bulk density (t/m³): ~ 0.30

Comment on density: Based on typical payload in a CHILW drum.
