WASTE SOURCE Waste predominantly arising from decontamination operations and maintenance work.

PHYSICAL CHARACTERISTICS

General description: The waste comprises general and soft trash including paper swabs, redundant PPE, sheet polythene etc. and metallic items such as filter housings, small tools & pipework.

Changes since waste generated: The waste has not undergone any physical/chemical processes or changes.

Bulk density (t/m³): ~ 0.60

Comment on density: Waste densities are estimated from the percentage of materials present in historical waste consignments.

CHEMICAL COMPOSITION

General description and components (%wt): The waste comprises general and soft trash including paper swabs, redundant PPE, sheet polythene etc. and metallic items such as filter housings, small tools & pipework. Percentage weight to be determined.

Chemical state: Neutral

Sheet metal proportion / thickness: Metals will be supercompacted and include the mild steel drums.

RADIOACTIVITY

Source: The activity has arisen from activation and fission products and contamination of reactor components

Uncertainty: This is based on the best current available information.

Measurement of radioactivities: Activities for future arising are based on the average activities calculated from historical waste consignments.

Chemical form of radionuclides: H-3: Present in the form of radiologically contaminated materials.
C-14: Present in the form of radiologically contaminated materials.
Cl-36: Not known to be present.
Se-79: Not known to be present.
Tc-99: Not known to be present.
I-129: Not known to be present.
Ra: Not known to be present.
Th: Not known to be present.
U: Present in the form of radiologically contaminated materials.
Np: Present in the form of radiologically contaminated materials.
Pu: Present in the form of radiologically contaminated materials.
